# **INS8048/8049/8048L/8049L/8048I/8049I NS87P50/8050U/8040U/87P50U/8050UI/8050UL Microcomputer/Microprocessor Family**

## **General Description**

The members of this family of microcomputers are self-contained, 8-bit parallel, 40-pin dual-in-line devices fabricated using National Semiconductor's scaled N-channel, silicon gate MOS process, XMOSTM. The 48-Series devices contain the system timing, control logic, ROM (where applicable) program memory, RAM data memory and 27 I/O lines necessary to implement dedicated control functions. All 48-Series devices are pin-compatible, differing only in the size of on-board ROM (where applicable) and RAM as shown below.

For applications requiring microwire serial communication, the NS8050U provides this feature.

MICROWIRE/PLUS™ consists basically of a three-wire communication port with a clocked 8-bit shift register. The three lines consist of a Serial Output (SO), a Serial Input (SI), and a Serial Clock (SK). The shift register is referred to as the serial input/output register. One 8050U must be designated as the master. The master supplies the clock for the MICROWIRE/PLUS system and initiates all data transfers. All transfers are between the master and one or more slaves. A slave may be any MICROWIRE™ peripheral or another 8050U with MICROWIRE/PLUS. MICROWIRE/PLUS communicates with a variety of MICROWIRE peripherals, such as the COP472 LCD Display Driver, COP494 EEPROM, or other 8050's configured as a peripheral. MICROWIRE/PLUS makes efficient use of the I/O lines. Thus, the MICROWIRE/PLUS expands the capability of the 8050U family.

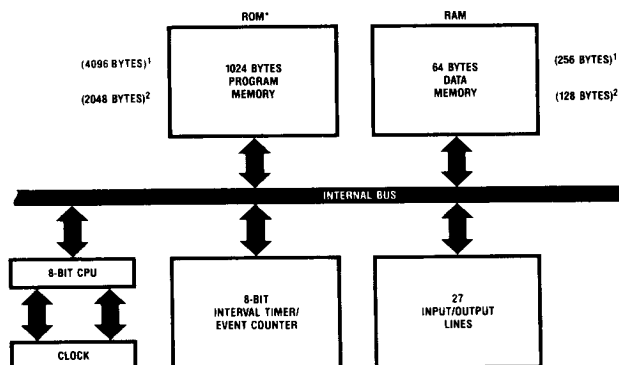

## **Features**

- The master/slave feature is programmable
- NS87P50 MICROWIRE/PLUS Piggy-back Microcomputer
- NS8040U MICROWIRE/PLUS ROM-less
- NS8050U MICROWIRE/PLUS in 40-pin package
- Transparent enhancement to the standard 8050 Microcomputer
- Ready interface to the MICROWIRE peripheral family
- Testable shifter "Done" flag available
- Selectable shift rate
- Two new MICROWIRE/PLUS control instructions
- Serial data exchange with only three wires
- 8-bit timer/control
- Binary and BCD arithmetic
- Single 5V power supply
- Low standby power
- Low voltage standby
- Expandable memory and I/O
- 1.36  $\mu$ s cycle, 11 MHz clock

Device	RAM Array	ROM Array
INS8048, 48L, 48I	64 x 8	1k x 8
INS8049, 49L, 48I	128 x 8	2k x 8
NS8050U, 50UL, 50UI	256 x 8	4k x 8
INS8035, 35L, 35I	64 x 8	N/A
INS8039, 39L, 39I	128 x 8	N/A
NS8040U, 40UL, 40UI	256 x 8	N/A
NS87P50U	64/128/256 x 8	1k/2k/4k x 8

\*Supersedes all data sheets and data books.

**Note:** Absolute Maximum Ratings indicate limits beyond which permanent damage may occur. Continuous operation at these limits is not intended; operation should be limited to those conditions specified under DC Electrical Characteristics. DC Electrical Characteristics are specified in INS8048-Series Data Sheet.

## Input and Output for AC Tests

TL/C/5488-3

**Note:** AC testing inputs are driven at 2.4V for a logic "1" and 0.45V for a logic "0". Output timing measurements are made at 2.0V for a logic "1" and 0.8V for a logic "0" (except X1, X2, and RESET) (Note 5).

## The INS8048/49/50-Series

The devices are designed to be efficient controllers. They have extensive bit handling capability as well as facilities for both binary and BCD arithmetic. Efficient use of program memory is derived from an instruction set comprised predominantly of single bytes. The remaining instructions are two bytes in length. Additional external memory may be added up to a maximum of 4k bytes of program memory and 256 bytes of data memory without paging.

## The INS8048L/49L/50L-Series

The XMOS 8048L Family now makes it possible for the designers to significantly reduce their power supply requirements. This will allow new designs where low power operation is a requirement for portability or battery back-up. The

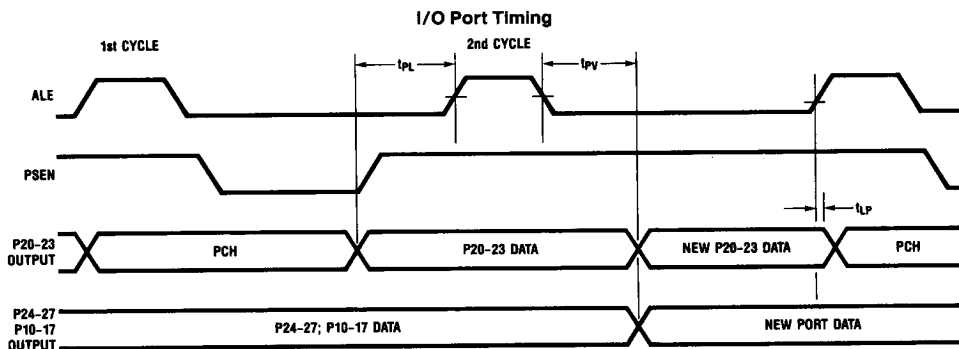

8048 Low Power Family will also mean longer product life and reliability because of the reduction in chip temperature within the package.

Due to the capabilities of the XMOS process and improvements in circuit design, the 8048L devices consume approximately 25% less than normal N-channel MOS devices available to the marketplace.

## The INS8048I/49I/50I-Series

These devices are designed to be efficient controllers in extended temperature range environments (-40°C to +85°C). Similar in every way to the standard devices, the industrial parts are differentiated only by extensive testing and screening to guarantee full functionality in the extended industrial temperature range.

## Timing Waveforms

TL/C/5488-4

## Timing Waveforms (Continued)

### ROM Verify Mode Timing

TL/C/5488-9

#### Recommended Test Methods:

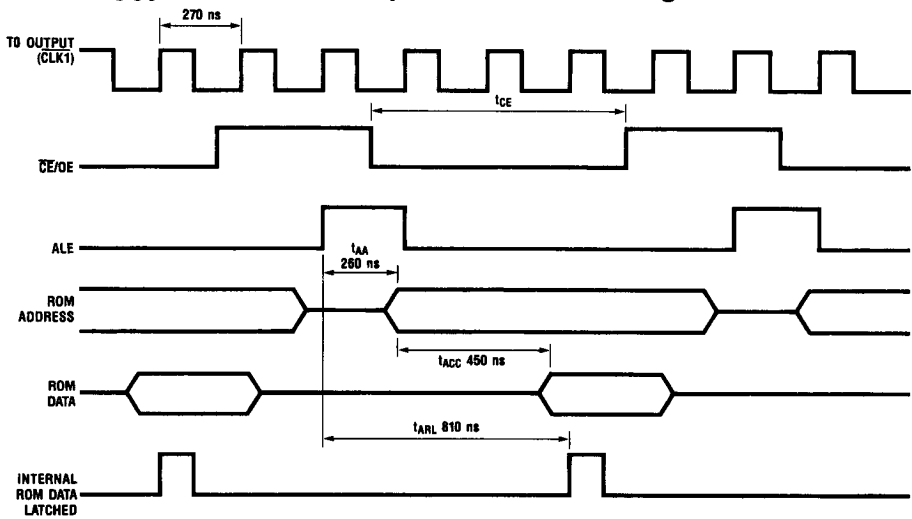

1. RESET must be low before EA goes high.
2. Sync to falling edge of ALE. Falling edge of ALE is machine cycle 4.
3. Force address in with RESET low for 21 machine cycles starting machine cycle 5.
4. Force address in with RESET high for 4 machine cycles.
5. Force RESET high for 12 machine cycles.
6. Force RESET high for 4 machine cycles. Data is valid on bus.
7. Force RESET low for 4 machine cycles.
8. Repeat steps 3 through 7 for other addresses.

### NS8050U MICROWIRE/PLUS Timing

TL/C/5488-10

NS87P50U Piggy-Back Microcomputer EPROM Timing

Frequency = 11 MHz

TL/C/5488-11

AC Electrical Characteristics

T<sub>A</sub> = 0°C to +70°C, V<sub>CC</sub> = +5V ± 10%, V<sub>SS</sub> = 0V, V<sub>DD</sub> = 3.6V to 5.5V, unless otherwise specified.

Symbol	Parameter	Test Conditions	Min	Typ	Max	Units
t <sub>ACC</sub>	ROM Address Setup to ROM Data (6 MHz Access Time)	6 MHz			850	ns
t <sub>ACC</sub>	ROM Address Setup to ROM Data (11 MHz Access Time)	11 MHz			450	ns
t <sub>CE</sub>	Chip Enable and Output Enable Active	11 MHz			870	ns
t <sub>AA</sub>	ALE to ROM Address Setup	11 MHz			260	ns
t <sub>ARL</sub>	ALE to ROM Data Latch	11 MHz			810	ns

Other AC Electrical Characteristics same as 48-Series.

DC Electrical Characteristics

T<sub>A</sub> = 0°C to +70°C, V<sub>CC</sub> = V<sub>DD</sub> = +5V ± 10%, V<sub>SS</sub> = 0V, unless otherwise specified.

Symbol	Parameter	Test Conditions	Min	Typ	Max	Units
I <sub>CC1</sub>	Current Available to EPROM	V <sub>CC</sub> = 5V			150	mA
I <sub>PP</sub>	V <sub>pp</sub> Current	V <sub>PP</sub> = 5V			5	mA
I <sub>DD</sub>	256 Words on Standby Current				20	mA
I <sub>DD</sub> + I <sub>CC</sub>	Total Supply Current (without EPROM)	T <sub>A</sub> = 25°C All Outputs Open		60	100	mA
V <sub>DD</sub>	Standby Power Supply		2.6		V <sub>CC</sub>	V

Other DC Electrical Characteristics same as 48-Series.

## Functional Pin Descriptions

### INPUT SIGNALS

**Reset (RESET):** An active low (0) input that initializes the processor and is used to verify program memory.

**Single Step (SS):** Active low (0) input which, in conjunction with ALE, can single step the processor through each instruction.

**External Access (EA):** An active high (1) input that forces all program memory fetches to reference external program memory.

**Testable Input 0 (T0):** Testable input pin using conditional branch functions JT0 (T0 = 1) or JNT0 (T0 = 0). T0 can be designated as the clock output using instruction ENT0 CLK. For NS8050U, T0 is also used as the SK clock output for MASTER and SK clock input for SLAVE in the MICRO-WIRE/PLUS mode. Done FLIP FLOP is tested by testing T0.

**Testable Input 1 (T1):** Testable input pin using conditional branch functions JT1 (T1 = 1) or JNT1 (T1 = 0). T1 can be designated as the Timer/Counter input from an external source using instruction STRT CNT.

**Interrupt (INT):** An active low input that initiates an interrupt when interrupt is enabled. Interrupt is disabled after a RESET. Also can be tested with instruction JN1 (INT = 0).

### OUTPUT SIGNALS

**Read Strobe (RD):** An active low output strobe activated during a Bus read. Can be used to enable data onto the Bus from an external device. Used as a Read Strobe to External Data Memory.

**Write Strobe (WR):** An active low output strobe activated during a Bus write. Used as a Write Strobe to External Data Memory.

**Program Store Enable (PSEN):** An active low output that occurs only during an external program memory fetch.

**Address Latch Enable (ALE):** An active high output that occurs once during each cycle and is useful as a clock output. The negative going edge of ALE strobes the address into External Data or Program Memory.

**Program (PROG):** This output (active out) provides the output strobe for INS8243 I/O Expander.

### INPUT/OUTPUT SIGNALS

**Crystal Input (XTAL1, XTAL2):** These two pins connect the crystal for internal oscillator operation. XTAL1 is the timing input for external source.

**Port 1 (P10–P17):** 8-bit quasi-bidirectional port.

**Port 2 (P20–P27):** 8-bit quasi-bidirectional port. During an external program memory fetch, the 4 high-order program counter bits occur at P20–P23. They also serve as a 4-bit I/O Expander Bus when the INS8243 I/O Expander is used.

**Bus (DB<sub>0</sub>–DB<sub>7</sub>):** True bidirectional port, either statically latched or synchronous. Can be written to using WR Strobe, or Read from using RD Strobe. During an External Program Memory fetch, the 8 lower-order program counter bits are present at this port. The addressed instruction appears on this bus when PSEN is low. During an external RAM data transaction, this port presents address and data under control of ALE, RD, WR.

**V<sub>SS</sub>:** Processor Ground potential.

**V<sub>DD</sub>:** V<sub>DD</sub> functions as the Low Power Standby Voltage. Can be tied to V<sub>CC</sub> if power-down operation is not required.

**V<sub>CC</sub> (Pin 40):** Primary power source for 48-Series devices.

## NS8050U MICROWIRE Mode

### Pin Descriptions

**Pin 1, Serial Clock (SK):** Input or output clocking signal to the MICROWIRE/PLUS serial circuitry.

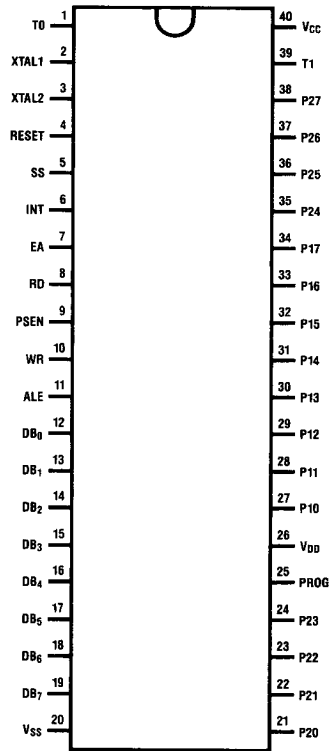

**Pin 38, Serial Input (SI):** Serial input to the 8-bit MICRO-WIRE/PLUS shift register.

**Pin 37, Serial Output (SO):** Serial output from the 8-bit MICRO-WIRE/PLUS shift register.

**Pin 3, XTAL2:** High-impedance input to oscillator circuit.

**Pin 2, XTAL1:** Low-impedance output from oscillator circuit.

## Functional Description

The following paragraphs contain the functional description of the major elements of the 48-Series microcomputer/microprocessor. (Figure 1) is a block diagram of the 48-Series devices. The data paths are illustrated in simplified form

to show how the various logic elements communicate with each other to implement the instruction set common to all devices.

## 48-Series Block Diagram

**FIGURE 1. 48-Series Detailed Block Diagram**

TL/C/5488-16

## Functional Description (Continued)

### PROGRAM MEMORY

The Program Memory (ROM) contained on the INS8048/49/50 devices is comprised of 1024, 2048 or 4096 8-bit bytes, respectively. As is seen by examining the 48-Series instruction set, these bytes may be program instructions, program data or ROM addressing data. The ROM for the above devices must be mask programmed at the National Semiconductor factory. The ROMless microcomputers, INS8035, INS8039 and INS8040, use external program memory. This makes program development straightforward using standard UV erasable PROMs to emulate a possible future single chip (using the on-board ROM) system. ROM addressing, up to a maximum of 4k, is accomplished by a 12-bit Program Counter (PC). The INS8048 and INS8049 will automatically address external memory when the boundary of their internal memories, 1k and 2k respectively, are exceeded. The binary value of the address selects one of the 8-bit bytes contained in ROM. A new address is load-

ed into the PC register during each instruction cycle. Unless the instruction is a transfer of control instruction, the PC register is loaded with the next sequential binary count value.

With reference to the Program Memory Map (see Figure 2) there are three ROM addresses which provide for the control of the microcomputer.

1. Memory Location 0000—Asserting the RESET (negative true) input to the microcomputer forces the first instruction to be fetched from address 0000.
2. Memory Location 0003—Asserting the interrupt (negative true) input to the microcomputer (when interrupt is enabled) forces a jump to subroutine.
3. Memory Location 0007—A Timer/Counter interrupt that results from Timer/Counter overflow (when enabled) forcing a jump to subroutine.

FIGURE 2. INS8048/49/50 Resident ROM Program Memory Map

TL/C/5488-17

### Functional Description (Continued)

### DATA MEMORY (RAM)

The resident RAM data memory is arranged as 64 (INS035/8048), 128 (INS039/8049), or 256 (NS8040/8050) bytes. RAM addressing is implemented indirectly via either of two 8-bit RAM pointer registers R0 and R1. These pointer registers are essentially the first two locations in the RAM (see *Figure 3*), addressing 00 and 01. RAM addressing may also be performed directly by 11 direct register instructions. The register area of the RAM array is made up of eight working registers that occupy either the first bank (0), locations 0 to 7, or the second bank (1), locations 24 to 31. The second bank of working registers is selected by using the Register Bank Switch instruction (SEL RB). If this bank is not used for working registers, it can be used as user RAM.

There is an 8-level stack after Bank 0 that occupies address locations 8 to 23. These RAM locations are addressed indirectly through R0, R1 or the 3-bit Stack Pointer (SP). The stack pointer keeps track of the return address and pushes each return address down into the stack. There are 8 levels of subroutine nesting possible in the stack because each address occupies 10 bits or more using two bytes in RAM. When the level of subroutine nesting is less than 8, the stacks not used may be utilized as user RAM locations.

**FIGURE 3. 8048-Series Resident  
RAM Data Memory Map**

TL/C/5488-18

## INPUT/OUTPUT

The 48-series devices have 27 lines of input/output organized as three 8-bit ports plus three test inputs. The three ports may be used as inputs, outputs or bidirectional ports. Ports 1 and 2 differ from Port 3 (Bus Port) in that they are quasi-bidirectional ports. Ports 1 and 2 can be used as input and output while being statically latched. If more I/O lines are required, Port 2 can also serve as a 4-bit I/O bus expander when used in conjunction with the INS8243 I/O Expander.

The bus port is a true bidirectional port and is either statically latched or synchronous. It can be written to using  $\overline{WR}$  strobe or read from using  $\overline{RD}$  strobe. During an external program memory fetch, the 8 lower-order program counter bits are present at this port. The addressed instruction appears on this bus when  $\overline{PSEN}$  is low. During an external RAM data transaction, this port presents address and data under control of  $\overline{ALE}$ ,  $\overline{RD}$ , and  $\overline{WR}$ .

## POWER-DOWN MODE

During the power-down mode,  $V_{DD}$ , which normally maintains the RAM cells, is the only pin that receives power.  $V_{CC}$ , which serves the CPU and ports, is dropped from a voltage of nominal 5 to 0 after the CPU is reset, so that the RAM cells are unaltered by the loss of power. When power is restored, the processor goes through the normal power-on procedure.

## MICROWIRE FUNCTIONS

New functions applicable to microwire mode are as follows:  
The SK output frequency is selected by writing into the P27 latch as follows:

- 0 = Instruction Cycle Divided by 1  
1 = Instruction Cycle Divided by 4

The SO output is enabled or disabled by writing into the P26 latch as follows:

- 0 = Enabled  
1 = Disabled

The DONE flip-flop is tested with the JT0, JNT0 instructions.

**FIGURE 4. Ports 1 and 2 Input/Output Circuit**

### Instruction Set

Table I details the 96 instructions common to both the microcomputers and the microprocessors. The table provides the mnemonic, function, and description, instruction code, number of cycles and, where applicable, flag settings.

TABLE I. Instruction Set

Mnemonic	Function	Description	Cycles	Bytes	Flags			
					C	AC	F0	F1
CONTROL								
EN I		Enable the External Interrupt Input.	1	1				
DIS I		Disable the External Interrupt Input.	1	1				
ENT0 CLK		Enable T0 as the Clock Output.	1	1				
SEL MB0	(DBF) $\leftarrow$ 0	Select Bank 0 (locations 0–2047) of Program Memory.	1	1				
SEL MB1	(DBF) $\leftarrow$ 1	Select Bank 1 (locations 2048–4095) of Program Memory.	1	1				
SEL RB0	(BS) $\leftarrow$ 0	Select Bank 0 (locations 0–7) of Data Memory.	1	1				
SEL RB1	(BS) $\leftarrow$ 1	Select Bank 1 (locations 24–31) of Data Memory.	1	1				
DATA MOVES								
MOV A, #data	(A) $\leftarrow$ data	Move Immediate the specified data into the Accumulator.	2	2				
MOV A, Rr	(A) $\leftarrow$ (Rr); r = 0–7	Move the contents of the designated register into the Accumulator.	1	1				
MOV A, @ Rr	(A) $\leftarrow$ ((Rr)); r = 0–1	Move Indirect the contents of data memory location into the Accumulator.	1	1				
MOV A, PSW	(A) $\leftarrow$ (PSW)	Move contents of the Program Status Word into the Accumulator.	1	1				
MOV Rr, #data	(Rr) $\leftarrow$ data; r = 0–7	Move Immediate the specified data into the designated register.	2	2				
MOV Rr, A	(Rr) $\leftarrow$ (A); r = 0–7	Move Accumulator contents into the designated register.	1	1				
MOV @ Rr, A	((Rr)) $\leftarrow$ (A); r = 0–1	Move Indirect Accumulator contents into data memory location.	1	1				
MOV @ Rr, #data	((Rr)) $\leftarrow$ data; r = 0–7	Move Immediate the specified data into data memory.	2	2				
MOV PSW, A	(PSW) $\leftarrow$ (A)	Move contents of Accumulator into the Program Status Word.	1	1	•	•	•	
MOVP A, @ A	(PC 0–7) $\leftarrow$ (A) (A) $\leftarrow$ ((PC))	Move the content of program memory location in the current page addressed by the content of Accumulator into the Accumulator.	2	1				
MOVP3 A, @ A	(PC 0–7) $\leftarrow$ (A) (PC 8–10) $\leftarrow$ 011 (A) $\leftarrow$ ((PC))	Move the content of program memory location in page 3 addressed by the content of Accumulator into the Accumulator.	2	1				
MOVX A, @ R	(A) $\leftarrow$ ((Rr)); r = 0–1	Move Indirect the contents of external data memory into the Accumulator.	2	1				
MOVX @ R, A	((Rr)) $\leftarrow$ (A); r = 0–1	Move Indirect the contents of the Accumulator into external data memory.	2	1				
XCH A, Rr	(A) $\longleftrightarrow$ (Rr); r = 0–7	Exchange the Accumulator and designated register's contents.	1	1				
XCH A, @ Rr	(A) $\longleftrightarrow$ ((Rr)); r = 0–1	Exchange Indirect contents of Accumulator and location in data memory.	1	1				
XCHD A, @ Rr	(A0–A3) $\longleftrightarrow$ ((Rr)) 0–3; R = 0–1	Exchange Indirect 4-bit contents of Accumulator and data memory.	1	1				

TABLE I. Instruction Set (Continued)

Mnemonic	Function	Description	Cycles	Bytes	Flags			
					C	AC	F0	F1
TIMER COUNTER								
EN TCNTI		Enable Internal Interrupt Flag for Timer/Counter output.	1	1				
DIS TCNTI		Disable Internal Interrupt Flag for Timer/Counter output.	1	1				
MOV A, T	(A) ← (T)	Move contents of Timer/Counter into Accumulator.	1	1				
MOV T, A	(T) ← (A)	Move contents of Accumulator into Timer/Counter.	1	1				
STOP TCNT		Stop Count for Event Counter.	1	1				
STRT CNT		Start Count for Event Counter.	1	1				
STRT T		Start Count for Timer.	1	1				
ACCUMULATOR								
ADD A, #data	(A) ← (A) + data	Add Immediate the specified Data to the Accumulator.	2	2	•	•		
ADD A, Rr	(A) ← (A) + (Rr) for r = 0–7	Add contents of designated register to the Accumulator.	1	1	•	•		
ADD A, @ Rr	(A) ← (A) + ((Rr)) for r = 0–1	Add Indirect the contents of data memory location of the Accumulator.	1	1	•	•		
ADDC A, #data	(A) ← (A)(C) + data	Add Immediate with carry the specified data to the Accumulator.	2	2	•	•		
ADDC A, Rr	(A) ← (A) + (C) + (Rr) for r = 0–7	Add with carry the contents of the designated register to the Accumulator.	1	1	•	•		
ADDC A, @ Rr	(A) ← (A) + (C) + ((Rr)) for r = 0–1	Add Indirect with carry the contents of data memory location to the Accumulator.	1	1	•	•		
ANL A, #data	(A) ← (A) AND data	Logical AND specified Immediate Data with Accumulator	2	2				
ANL A, Rr	(A) ← (A) AND (Rr) for r = 0–7	Logical AND contents of designated register with Accumulator	1	1				
ANL A, @ Rr	(A) ← (A) AND ((Rr)) for r = 0–1	Logical AND Indirect the contents of data memory with Accumulator.	1	1				
CPL A	(A) ← NOT (A)	Complement the contents of the Accumulator.	1	1				
CLR A	A ← 0	CLEAR the contents of the Accumulator.	1	1				
DA A		DECIMAL ADJUST the contents of the Accumulator.	1	1	•			
DEC A	(A) ← (A) – 1	DECREMENT by 1 the Accumulator's contents.	1	1				
INC A	(A) ← (A) + 1	Increment by 1 the Accumulator's contents.	1	1				
ORL A, #data	(A) ← (A) OR data	Logical OR specified immediate data with Accumulator.	2	2				
ORL A, Rr	(A) ← (A) OR (Rr) for r = 0–7	Logical OR contents of designated register with Accumulator.	1	1				
ORL A, @ Rr	(A) ← (A) OR ((Rr)) for r = 0–1	Logical OR Indirect the contents of data memory location with Accumulator.	1	1				

TABLE I. Instruction Set (Continued)

Mnemonic	Function	Description	Cycles	Bytes	Flags			
					C	AC	F0	F1
ACCUMULATOR (Continued)								
RLA	$(An + 1) \leftarrow (An)$ for $n = 0-6$ $(A0) \leftarrow (A7)$	Rotate Accumulator left by 1-bit without carry.	1	1				
RLC A	$(An + 1) \leftarrow (An); n = 0-6$ $(A0) \leftarrow (C)$ $(C) \leftarrow (A7)$	Rotate Accumulator left by 1-bit through carry.	1	1	•			
RR A	$(An) \leftarrow (An + 1); n = 0-6$ $(A7) \leftarrow (A0)$	Rotate Accumulator right by 1-bit without carry.	1	1				
RRC A	$(An) \leftarrow (An + 1); n = 0-6$ $(A7) \leftarrow (C)$ $(C) \leftarrow (A0)$	Rotate Accumulator right by 1-bit through carry.	1	1	•			
SWAP	$(A4-A7) \longleftrightarrow (A0-A3)$	Swap the 2 4-bit nibbles in the Accumulator.	1	1				
XRL A, #data	$(A) \leftarrow (A) \text{ XOR data}$	Logical XOR Immediate specified data with Accumulator.	2	2				
XRL A, Rr	$(A) \leftarrow (A) \text{ XOR } (Rr)$ for $r = 0-7$	Logical XOR contents of designated register with Accumulator.	1	1				
XRL A, @ Rr	$(A) \leftarrow (A) \text{ XOR } ((Rr))$ for $r = 0-1$	Logical XOR Indirect the contents of data memory location with Accumulator.	1	1				
BRANCH								
DJNZ Rr, addr	$(Rr) \leftarrow (Rr) - 1; r = 0-7$ if $(Rr) \neq 0$ ; $(PC 0-7) \leftarrow \text{addr}$	Decrement the specified register and test contents.	2	2				
JBb addr	$(PC 0-7) \leftarrow \text{addr}$ if $Bb = 1$ $(PC) \leftarrow (PC) + 2$ if $BB = 0$	Jump to specified address if Accumulator bit is set.	2	2				
JC addr	$(PC 0-7) \leftarrow \text{addr}$ if $C = 1$ $(PC) \leftarrow (PC) + 2$ if $C = 0$	Jump to specified address if carry flag is set.	2	2				
JFO addr	$(PC 0-7) \leftarrow \text{addr}$ if $F0 = 1$ $(PC) \leftarrow (PC) + 2$ if $F0 = 0$	Jump to specified address if Flag F0 is set.	2	2				
JFI addr	$(PC 0-7) \leftarrow \text{addr}$ if $F1 = 1$ $(PC) \leftarrow (PC) + 2$ if $F1 = 0$	Jump to specified address if Flag F1 is set.	2	2				
JMP addr	$(PC 8-10) \leftarrow 8-10$ $(PC 0-7) \leftarrow \text{addr } 0-7$ $(PC 11) \leftarrow \text{DBF}$	Direct Jump to specified address with the 2k address block.	2	2				
JMPP @ A	$(PC 0-7) \leftarrow ((A))$	Jump Indirect to specified address pointed to by the Accumulator in current page.	2	1				
JNC addr	$(PC 0-7) \leftarrow \text{addr}$ if $C = 0$ $(PC) \leftarrow (PC) + 2$ if $C = 1$	Jump to specified address if carry flag is low.	2	2				
JNI addr	$(PC 0-7) \leftarrow \text{addr}$ if $I = 0$ $(PC) \leftarrow (PC) + 2$ if $I = 1$	Jump to specified address if interrupt is low.	2	2				
JNT0 addr	$(PC 0-7) \leftarrow \text{addr}$ if $T0 = 0$ $(PC) \leftarrow (PC) + 2$ if $T0 = 1$	Jump to specified address if Test 0 is low.	2	2				
JNT1 addr	$(PC 0-7) \leftarrow \text{addr}$ if $T1 = 0$ $(PC) \leftarrow (PC) + 2$ if $T1 = 1$	Jump to specified address if Test 1 is low.	2	2				

TABLE I. Instruction Set (Continued)

					C	AC	F0	F1
BRANCH (Continued)								
JNZ addr	(PC 0-7) ← addr if A ≠ 0 (PC) ← (PC) + 2 if A = 0	Jump to specified address if Accumulator is non-zero.	2	2				
JFT addr	(PC 0-7) ← addr if TF = 1 (PC) ← (PC) + 2 if TF = 0	Jump to specified address if Timer Flag is set to 1.	2	2				
JT0 addr	(PC 0-7) ← addr if T0 = 1 (PC) ← (PC) + 2 if T0 = 0	Jump to specified address if Test 0 is a 1.	2	2				
JT1 addr	(PC 0-7) ← if T1 = 1 (PC) ← (PC) + 2 if T1 = 0	Jump to specified address if Test 1 is a 1.	2	2				
JZ addr	(PC 0-7) ← addr if A = 0 (PC) ← (PC) + 1 if A = 1	Jump to specified address if Accumulator is 0.	2	2				
INPUT/OUTPUT								
ANL BUS, # data	(BUS) ← (BUS) AND data	Logical AND Immediate specified data with contents of BUS.	2	2				
ANL Pp, # data	(Pp) ← (Pp) AND data; p = 1-2	Logical AND Immediate specified data with designated port (1 or 2).	2	2				
ANLD Pp, A	(Pp) ← (Pp) AND (A0-A3); p = 4-7	Logical AND contents of Accumulator with designated port (4-7).	2	1				
IN A, Pp	(A) ← (Pp); p = 1-2	Input data from designated port (1-2) into Accumulator.	2	1				
INS A, BUS	(A) ← (BUS)	Input strobed BUS data into Accumulator.	2	1				
MOVD A, Pp	(A0-A3) ← (Pp); p = 4-7 (A4-A7) ← 0	Move contents of designated port (4-7) into Accumulator.	2	1				
MOVD Pp, A	(Pp) ← (A0-A3); p = 4-7	Move contents of Accumulator to designated port (4-7).	2	1				
ORL BUS, # data	(BUS) ← (BUS) OR data	Logical OR Immediate specified data with contents of BUS.	2	2				
ORLD Pp, A	(Pp) ← (Pp) OR (A0-A3); p = 4-7	Logical OR contents of Accumulator with designated port (4-7).	2	1				
ORL Pp, # data	(Pp) ← (Pp) OR data; p = 1-2	Logical OR Immediate specified data with designated port (1-2).	2	2				
OUTL BUS, A	(BUS) ← (A)	Output contents of Accumulator onto BUS.	2	1				
OUTL Pp, A	(Pp) ← (A); p = 1-2	Output contents of Accumulator to designated port (1-2).	2	1				
REGISTERS								
DEC Rr	(Rr) ← (Rr) - 1; r = 0-7	Decrement by 1 contents of designated register.	1	1				
INC Rr	(Rr) ← (Rr) + 1; r = 0-7	Increment by 1 contents of designated register.	1	1				
INC @ Rr	((Rr)) ← ((Rr)) + 1; r = 0-1	Increment Indirect by 1 the contents of data memory location.	1	1

CPL F0	(F0) ← NOT (F0)	Complement Content of Flag F0.	1	1			•	
CPL F1	(F1) ← NOT (F1)	Complement Content of Flag F1.	1	1				•
CLR C	(C) ← 0	Clear content of carry bit to 0.	1	1	•			
CLR F0	(F0) ← 0	Clear content of Flag 0 to 0.	1	1			•	
CLR F1	(F1) ← 0	Clear content of Flag 1 to 0.	1	1				•
MISCELLANEOUS								
NOP		No operation	1	1				
MICROWIRE INSTRUCTIONS								
XCHM	A ↔ SIO	Reset DONE flip-flop, Clock counter. SK designated as an output. MICROWIRE/PLUS mode selected.						
XCHS	A ↔ SIO	Reset DONE flip-flop, Clock counter. SK designated as an input. MICROWIRE/PLUS mode selected.						

## Symbol Definitions

Symbol	Description
A	Accumulator
AC	Auxiliary Carry Flag
addr	Program Memory Address (12 bits)
b	Bit Designator (b = 0-7)
BS	Bank Switch
Bus	Bus Port
C	Carry Flag
CLK	Clock Signal
CNT	Event Counter
D	Nibble Designator (4 bits)
data	Number of Expression (8 bits)
DBF	Memory Bank Flip-Flop
F <sub>0</sub> , F <sub>1</sub>	Flags 0, 1
I	Interrupt
P	"In-Page" Operation Designator

Symbol	Description
p	Port Designator (p = 1, 2 or 4-7)
PSW	Program Status Word
r	Register Designator (r = 0, 1 or 0-7)
SP	Stack Pointer
T	Timer
TF	Timer Flag
T <sub>0</sub> , T <sub>1</sub>	Testable Flags 0, 1
X	External RAM
#	Prefix for Immediate Data
@	Prefix for Indirect Address
\$	Program Counter's Current Value
(x)	Contents of Register
((xx))	Contents of Memory Location Addressed by the Contents of Register
	Replaced by

## Typical Applications

Figure 5 shows a typical remote data acquisition system with an INS8250 Programmable Asynchronous Communication System, which can receive commands or update information from a supervisory computer. The figure also shows an INS8294 CMOS DVM that receives data at  $V_{IN}$  and displays the data on the 7-segment local display unit. Data is transferred from the INS8294 to the INS8094 via National's MICROBUST™.

Figure 6 offers an example system that utilizes the unique capacity of these parts. With the addition of an ADC0837 serial A/D converter and a DM74LS138 3-to-8 decoder, the basic INS8048 and MM5445/MM5446/MM5447/MM5448, MM5450/MM5451/MM5452/MM5453 system can display

inputs from 8 separate I/O devices using only one of the INS8048's I/O ports. The other port and the bus can handle any number of tasks. Shown here is the use of Port 2 to control a keyboard, used to enter limits on the inputs. The bus is used to control relay drivers which will regulate the I/O devices when the limits (previously set on the keyboard) are met.

Figure 7 shows a typical way to use the 48-Series microcontrollers in a stand-alone system.

Crystal used is parallel resonant, AT cut and 1 MHz to 6 MHz. All outputs are standard TTL compatible at 5V.

## NS8050U Applications (Continued)

MICROWIRE/PLUS consists of a three wire communications port with a clocked 8-bit shift register. The three lines consist of Serial Output (SO), Serial Input (SI) and Serial Clock (SK) and the Shift register is referred to as the Serial Input/Output Register. One 8050U is designated the master and it supplies the clock for the MICROWIRE/PLUS system and initiates data transfer. All transfers are between the master and one or more slaves. A slave can be any MICROWIRE peripheral or another 8050U with MICROWIRE/PLUS.

## MICROWIRE Peripherals

### DATA ACQUISITION

COP43X 8-bit A/D converters

### FREQUENCY GENERATORS AND COUNTERS

COP452 Frequency generator and counter

### DISPLAY DRIVERS

COP470 Four-digit vacuum fluorescent display driver

COP472 Triplex liquid crystal display controller

MM5445, 5446, Vacuum fluorescent display driver  
5447, 5448

MM5450, 5451 LED display driver

MM5452, 5453 Liquid crystal display driver

MM5480, 5481 LED display driver

MM5484, 5485 16- and 11-segment LED display driver

MM58201 Multiplexed LCD driver

MM58248 High-voltage display driver

### MEMORIES

COP498 Low-power CMOS RAM and timer

COP499 Low-power CMOS RAM

COP494 256-bit, 5V only EEPROM

COP495 1024-bit, 5V only EEPROM

### RADIO TUNING

DS890X AM/FM digital phase-locked loop synthesizer

Peripheral device information may be found in the COPS Microcontrollers Databook.
